

WWW.BEA.GOV

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, THURSDAY, June 23, 2005

Clifford Woodruff: (202) 606-9234

BEA 05-29

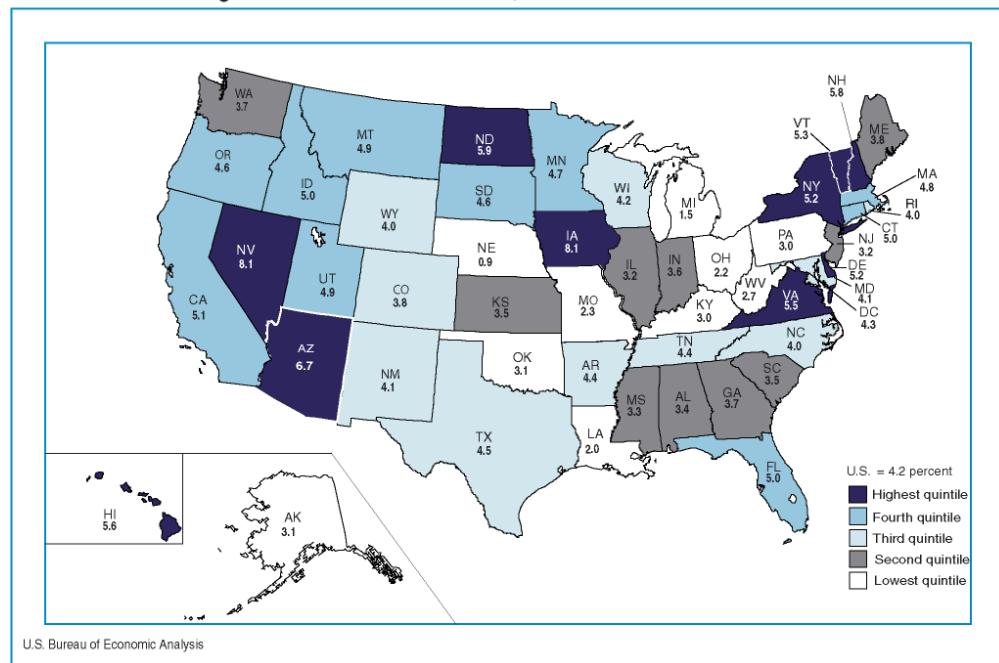

ECONOMIES GROW IN ALL STATES IN 2004*Prototype Gross State Product (GSP) Estimates*

In 2004, strong U.S. real economic growth was widespread; real GSP grew in all 50 states and the District of Columbia, according to estimates released by the U.S. Bureau of Economic Analysis.¹ GSP is the most comprehensive measure of overall economic activity in each state.

Highlights for 2004

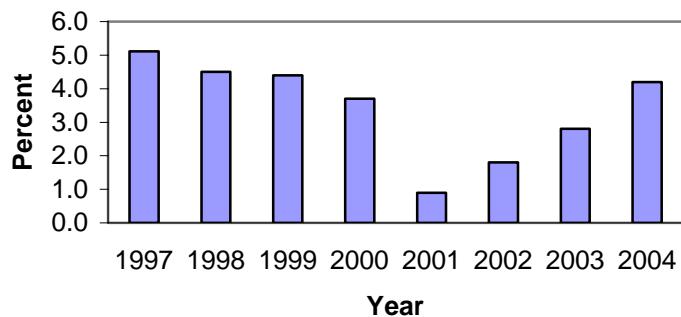

- Growth in real U.S. GSP accelerated from 2.8 percent in 2003 to 4.2 percent in 2004; all but seven states shared in that acceleration.
- The financial services and information-communications-technology sectors were the largest contributors to growth, and most of the fastest-growing states have large concentrations in one or both of these sectors.

Chart 1. Percent Change in Real Gross State Product, 2003-2004

¹ 2004 estimates are based on a prototype methodology to speed up release of BEA's GSP estimates—one of BEA's major goals in its strategic plan, subject to funding. BEA is interested in the views of its data users on this initiative; please send your comments to gspread@bea.gov. Estimates for 2003 and earlier are based on BEA's regular GSP methodology. For further details, see the forthcoming July 2005 *Survey of Current Business* article on gross state product. Revised 2004 GSP totals, along with prototype accelerated NAICS sector-level estimates of GSP for 2004, will be released in the Fall 2005.

Real US GSP Growth Rates, 1997 - 2004

Industry Detail for 2003

- Real GSP grew in all states except Alaska. Growth in services-providing industries was strong in all states.
- The financial services sector was the largest contributor to growth in 19 states; durable goods manufacturing was the largest contributor to growth in 12 states.

Rewvisions to the Estimates

- BEA's improved measures of banking output, fully incorporated into this set of GSP estimates, resulted in stronger growth in that industry for 44 states.
- Overall, the revisions had a limited impact on relative growth rates across states. The earlier prototype estimates for 2003 indicated successfully whether a state's growth was high, medium, or low (relative to national growth) for 78 percent of the states.

Tables 1-4 show these results in more detail; complete detail is available on BEA's web site at www.bea.gov.

BEA's national, international, regional, and industry estimates; the *Survey of Current Business*; and BEA news releases are available without charge on BEA's Web site at www.bea.gov. By visiting the site, you can also subscribe to receive free e-mail summaries of BEA releases and announcements.

Prototype accelerated estimates

The prototype 2004 GSP estimates are being released six months after the reference year, an acceleration of 12 months from past release schedules. Both current-dollar and real (chained) total GSP estimates for 2004 are provided in the release. The 2004 estimates are based on BEA earnings by industry estimates released March 28, 2005 and on accelerated GDP by industry estimates released April 20, 2005. More information on the methodology used to produce the prototype estimates, on the regular (revised) GSP estimates for 1997-2003, and on revisions to the GSP estimates will appear in an article in the July 2005 issue of the *Survey of Current Business*, BEA's monthly journal.

This release marks the second step toward regularly providing more timely estimates of GSP by industry. The first step was the December 2004 release of prototype current-dollar total GSP estimates for 2003. In the fall of 2005, as part of its strategic plan goal of significantly accelerating

the release of its estimates, BEA plans to release both current-dollar and real NAICS sector-level GSP estimates for 2004—10 months after the reference year and an acceleration of 8 months from past release schedules.

BEA is interested in your comments

Given the experimental nature of the accelerated estimates, BEA is interested in your views on the proposed methodology for the estimates, the appropriate level of industry detail, and the tradeoff between accuracy and timeliness. We encourage your feedback on the value of this initiative in BEA's Strategic Plan. Please e-mail your comments to BEA's Associate Director for Regional Economics, John W. Ruser, at gspread@bea.gov.

Explanatory Notes

Definitions

GSP is the state counterpart of the Nation's gross domestic product (GDP), the Bureau's featured and most comprehensive measure of U.S. economic activity. GSP for a state is derived as the sum of the GSP originating in all the industries in the state.

Real GSP is an inflation-adjusted measure of each state's gross product that is based on national prices for the goods and services produced within that state. The estimates of real GSP and of quantity indexes with a base year of 2000 are derived by applying national implicit price deflators to the current-dollar GSP estimates for the 63 SIC industries for years 1977-1997, and for the 81 NAICS industries for years 1997 forward. Then, the chain-type index formula that is used in the national accounts is used to calculate the estimates of total real GSP and of real GSP at more aggregated industry levels.

The relation of GSP to Gross Domestic Product (GDP)

An industry's GSP, or its value added, is equal to its gross output (sales or receipts and other operating income, commodity taxes, and inventory change) minus its intermediate inputs (consumption of goods and services purchased from other U.S. industries or imported). Thus, the GSP accounts provide data by industry and state that are consistent with gross domestic product (GDP) in the national income and product accounts, and with the GDP by industry accounts.

However, for the NAICS-based GSP estimates for years 1997 forward, total GSP for the Nation differs from GDP in the national income and product accounts for two reasons. First, GSP excludes, and GDP and GDP by industry include, compensation of Federal civilian and military personnel stationed abroad and government consumption of fixed capital for military structures located abroad and for military equipment except domestically located office equipment. Second, GSP and GDP often have different revision schedules.

For the SIC-based GSP estimates for years 1977-1997, there is a third reason why U.S. GSP differs from GDP for the Nation. Like the national estimates of GDP by industry, GSP is measured as the sum of the distributions by industry of the components of gross domestic income, which differs from GDP by the statistical discrepancy. For 1997 forward, the statistical discrepancy is distributed among all private industries. This is not done for the SIC-based estimates.

Table 1. Real Gross State Product, 2000 - 2004
